Job Title: GMT: Software Engineer, Global Markets Technology

Position Description

The GMT Post Trade technology team provides regional and global technology solutions for our business partners including Global Markets Operations, covering transaction processing, settlements, and asset servicing for equities and fixed income products.

We are looking for a highly self-motivated Developer with good programming skills and has interests in financial markets. The successful candidate will partner with stakeholders from business, operations, and technology teams to execute complex and time-critical projects within the securities domain. The candidate will be actively involved in developing solutions on our strategic systems to fulfill business requirements. Our next generation strategic systems are written in Scala and using Event Sourcing Model. We use Scrum and Kanban agile delivery methodologies, with a focus on ATDD/BDD & TDD. This is a great opportunity for people who are interested in software engineering and large-scale platform/projects.

Key Responsibilities

- Develop robust and scalable technology solutions to meet business requirements using modern software development best practices.
- Collaborate with regional and global teams to design and build new functionalities in relevant languages and/or other shared (and existing) platforms that align with our blueprint.
- Clearly communicate technical details effectively across disciplines and teams, including to senior leadership.
- Collaborate, coach and mentor team of highly motivated technologists.

Key Requirements

<u>Technical Skills</u>

- Professional experience developing solutions with Scala/Java. Well versed with both OOPS and Functional programming principles.
- Knowledge & experience in ReactJS / Elastic Search is an added advantage.
- Strong development expertise and understanding of event sourcing and CQRS principles.
- Experienced in using design patterns and following best software engineering practices.
- An understanding of fundamental algorithms and ability to optimize the existing code.
- Experience in writing Specification by Example / Feature Files / ATDD / BDD.
- Experience in SDLC automation tools such as Jenkins, Gradle, GitHub, Artifactory and Ansible.
- Follows clean code principles.
- Rigorously adheres to Test Driven Development practices including continual integration.
- Experience of Scrum/Agile methods.
- Strong team player with excellent interpersonal skills, communication & collaborative working skills.

- Proficient written and verbal communication skills in English to support and shape the platform and clearly articulate technical designs and concepts.
- Knowledge of AMPS messaging infrastructure and database programming is a plus.
- Good understanding of capital markets especially securities trade processing, clearing, settlements is a plus.
- Ability to multi-task and handle multiple requests
- Ability to work in a fast paced, challenging environment
